

CLASS 09 / OCT 20 / U05

SITE ANALYSIS WITH MIXTLI

P3c + P3d CHECKPOINT — FIELD TO SITE, SITE TO DECISION

NOTHING DUE

MIDTERM NEXT CLASS — WEEK 10 — OCT 27

A SITE ANALYSIS IS A FIELD

Last class you built a field from distance. A site analysis reads the same way.

	ATTRACTOR FIELD — P3c	SITE FIELD — P3d
MEASURE	Distance to the attractor, at every point of the grid.	A site value at every point, computed by Mixtli.
REMAP	Distance range pushed into grey or a line property.	The value range pushed into colour.
LEGEND	Near → far, with input and output ranges.	What the colour means, with units.
USE	The value drives a line the pen draws.	The reading informs one spatial decision.

MEASURE → REMAP → LEGEND. THE SAME THREE STEPS. THE SITE VERSION ENDS IN A DECISION.

MIXTLI — RECORD THE SITE FIRST

Mixtli is a Blender add-on provided by the instructor. Before any analysis, record the site.

SOURCE

Where the site model or data came from. Name it on the sheet.

UNITS

What one unit is. Check it against one known dimension.

SCALE

The scale of the site plan or base view, with a bar.

ORIENTATION

North, and how the model is placed relative to it.

AND ONE SENTENCE: WHY THIS SITE

A site you can document, and a reason you chose it. The reason becomes your analysis question.

P3d CHECKPOINT TODAY: YOUR SITE, ONE ANALYSIS WITH A LEGEND, AND A QUESTION.

ONE ANALYSIS, ONE DECISION

The add-on does the computation. The question, the comparison and the reading are yours.

01 ANALYZE

One analysis. Record its type, inputs and settings. Legend and units on the image.

02 COMPARE

Change one thing — a setting, a time or a condition — and show both.

03 INTERPRET

Say what the output measures. Read it as a field: a value at every point, remapped to colour.

04 DECIDE

Name one spatial decision the reading supports, and draw it on the plan.

SAME LOGIC AS P3c: A MEASURED VALUE, A STATED RANGE, A LEGEND, THEN A CONSEQUENCE.

A colourful image with no legend and no decision is not an analysis.

THE P3d SHEET — ONE 17 × 11

Four zones on one landscape sheet. Every zone answers to the same question.

01

ANNOTATED SITE PLAN
OR BASE VIEW

N ↑ SCALE BAR SOURCE · UNITS

02

MAPPED ANALYSIS

LEGEND + UNITS

03

ONE COMPARISON

A

B

04

INTERPRETATION → ONE DECISION

EACH ZONE MUST SAY

01 Where: the site, annotated. Source, units, scale, north.

02 What: the analysis, mapped, with a legend and units.

03 Against what: one change of setting, time or condition.

04 So what: what the output measures, and the one decision it informs.

ONE SHEET. ONE QUESTION. ONE DECISION.

P3c CHECKPOINT — READ THE TEST PLOT

Bring the grayscale field, the line translation and a small test plot. Read the paper, not the screen.

PEN

Does it draw clean from first stroke to last? No skips, no blots.

Wrong? Change the pen or the speed.

PAPER

Right size and weight, fixed flat.
Does the ink bleed or wet through?

Wrong? Change the paper.

LINE DENSITY

Darkest area still separate lines?
Lightest area still visible?

Wrong? Change the mapping.

SIZE

Crop plotted at 100%. Final set to 17 × 11 or the confirmed plotter size.

Wrong? Fix the SVG export.

ONE CHANGE AT A TIME. REPLOT THE SAME CROP. KEEP BOTH TESTS FOR THE SHEET.

REMINDER — P3d REQUIREMENTS

Visual quality 35% · computational understanding 25% · technical execution 20% · experimentation 10% · requirements and identity 10%.

01

Pick a site you can document and state why you chose it. Record the source of the site model or data, its units, scale and orientation.

02

Analyze the site with the Mixtli add-on for Blender, provided by the instructor. Record the analysis type, inputs and settings.

03

Make one 17 × 11 inch sheet with an annotated site plan or base view, the mapped analysis with a legend and units, and one comparison of settings, times or conditions.

04

Explain what the output measures, how it reads as a field — the same distance-and-remap logic as P3c — and how it informs one spatial decision on the site.

05

Submit the working file and dependencies. The add-on does the computation; the question, comparison and interpretation are yours.

CHECKPOINT · WEEK 9 — Oct 20 — Bring your chosen site, one Mixtli analysis with a legend and a stated analysis question.

MIDTERM CHECKLIST — PROJECTS 1–3

Next class. Due then: GSM · P2b · P3c · P3d · MID. Tick every line before you print.

01

Print and present Project 1: the four-page Graphic Standards Manual.

02

Present Project 2: the CSG process sheet, the 3D printed CSG object and its process sheet.

03

Present Project 3: one module sheet, two array sheets, the plotted attractor field drawing and one Mixtli site-analysis sheet.

04

Bring editable files and dependencies. Change a parameter live, predict the result and explain the nodes or the Mixtli analysis settings.

05

The review assesses revision and coherence across Projects 1-3. Earlier assignment grades remain separate. Project 4 follows the review.

NOW — CHECKPOINTS

Rest of the class: one table at a time, then work on what the review found.

✓

P3c: test plot read for pen, paper, line density and size

✓

P3c: mapping fixed, final plot at full size booked

✓

P3d: site recorded — source, units, scale, orientation — and one question

✓

P3d: one Mixtli analysis with legend and units, one comparison, one decision

✓

Midterm: every item on the checklist located, printed or booked for printing

FIX THE MAPPING TODAY. NEXT WEEK THERE IS NO TIME TO REPLOT.

BEFORE NEXT CLASS

MIDTERM

Next class, Week 10 — Oct 27, is the midterm review of Projects 1–3. Due then: GSM, P2b, P3c, P3d and MID.

PLOT

Plot the final P3c drawing at full size. Keep the SVG, a photograph or scan of the plot and the editable graph.

SHEET

Finish the P3d sheet: annotated site, mapped analysis with legend and units, one comparison, one decision.

BRING

Printed sheets, the plotted drawing, the 3D print, and editable files with dependencies. Be ready to change a parameter live.
